Meeting records  Transcript *(Some recordings unavailable)*

Summary

Meeting focused on aligning AI consulting strategies for client efficiency gains through structured process re-engineering and planning.

Strategic AI Consulting Alignment

Participants identified that true AI readiness requires process re-architecting rather than just cost cutting. The discussion emphasized transitioning toward agent based models to scale productivity per employee.

Consulting Methodology and Pricing

A phased implementation framework was proposed involving process audits before AI integration to ensure tangible efficiency gains. The group settled on a project pricing structure of 40k to 50k for an onsite engagement.

Operational Scope for Weights

The project will target sales, marketing, and business development functions while excluding software development to meet aggressive growth targets. It was decided that the initiative will utilize a structured onsite assessment to address data silos and revenue projection.

Decisions

Aligned

- **Prioritization of process re-engineering** The consulting strategy is defined to start with process re-engineering before introducing deterministic or AI layers to improve client efficiency.
- **On-site consulting engagement preference** Consulting engagements for process assessment and planning are agreed to be conducted on-site to optimize collaboration and productivity.

We've **updated the Decisions section** using your feedback.

Let us know what you think: [Helpful](#) or [Not Helpful](#)

Next steps

- ☐ [Balasubramanian GR] Create Consulting Proposal: Develop a comprehensive document outlining the discovery process, six week project timeline, and engagement strategy. Include anticipated efficiency gains and deliverables for the client.
- ☐ [Balasubramanian GR] Draft Assessment Questionnaire: Create a set of targeted questions for relevant departments to identify business process improvements. Structure the list to facilitate the discovery phase of the engagement.
- ☐ [Balasubramanian GR] Prepare Strategy Proposal: Research and prepare a structured proposal for marketing and sales revenue growth strategies based on the discussed concepts.
- ☐ [Balasubramanian GR] Consult Philip: Discuss the potential project with Philip to gather his feedback and ideas.
- ☐ [Balasubramanian GR] Schedule Follow-up: Schedule a follow-up meeting for the end of the week or early next week to present findings.

- [Balasubramanian GR] Recruit Resources: Identify additional personnel within the organization or through personal networks to support project execution.

Details

- **Introductions and Professional Background:** Balasubramanian GR provided an overview of their background, noting that they graduated in the same engineering batch as Philip and later earned a post-graduation management degree in 2012 ([00:00:52](#)). Balasubramanian GR spent approximately 8.5 years heading the data science and analytics division of a domain name registry in Mumbai, followed by 4.5 years running a data science and analytics consulting firm, and has been with TechJS since the beginning of May ([00:01:47](#)).
- **Current Project Portfolio:** Balasubramanian GR updated Gerry Perkel on current active projects, specifically the Northstar Recycling (NSR) PHOPS project, which they are now handling, and the CRM Phase 3 project, for which they are waiting for approval from leadership after completing discovery and design sessions. Additionally, Balasubramanian GR recently assumed responsibility for the Ops AI project ([00:02:57](#)).
- **AI Implementation Challenges:** Gerry Perkel identified a common challenge where companies recognize the need for AI but lack a clear roadmap or understanding of how to become AI or agentic AI-centric ([00:03:58](#)). Gerry Perkel expressed that the primary goal is to double revenue per white-collar employee within two years, a shift that requires moving beyond simply using AI for cost-cutting and instead using it to transform processes and productivity within smaller departmental teams ([00:05:28](#)).
- **AI Readiness Consulting:** Balasubramanian GR noted that many executives currently view AI primarily as a cost-cutting tool, a perception that limits the full potential for revenue generation. Balasubramanian GR proposed a consulting framework similar to an "AI readiness report" or audit, where they would analyze a company's business flows to identify opportunities for efficiency and revenue growth rather than focusing exclusively on reducing human resources ([00:09:14](#)).

- Process Re-architecting and Business Case:** Gerry Perkel illustrated a scenario using a business development department with 8-10 employees, questioning if they could move toward an AI-agent-based model that operates 24/7 ([00:14:19](#)). Gerry Perkel emphasized that for these opportunities, there is a two-step requirement: first, someone must perform process mapping and re-architecting to determine where AI can replace or augment current human workflows, and second, a team must implement those solutions, which is the core strength of TechJS ([00:11:53](#)) ([00:16:40](#)).
- Phased Implementation Framework:** Balasubramanian GR recommended a structured approach to engagements that begins with simple process re-engineering before attempting to force-fit AI solutions ([00:18:09](#)). If re-engineering does not achieve the required results, they would move to a deterministic layer, and finally to an AI layer, providing clients with a report detailing these steps and the projected efficiency gains rather than moving directly to implementation ([00:19:31](#)).
- The Value of Trusted Partnerships:** Gerry Perkel discussed the "build versus buy" dilemma, noting that while some clients attempt to build internal AI departments, they often end up with a disjointed, insecure mess of tools ([00:21:54](#)). Gerry Perkel argued that TechJS acts as a vital partner, providing the "brute force" necessary to build robust, hardened AI solutions that clients cannot easily produce in-house ([00:23:07](#)).
- Onsite Work Preference:** Both Balasubramanian GR and Gerry Perkel agreed that consulting work, particularly when reimagining processes and whiteboarding workflows, is significantly more efficient and productive when conducted onsite rather than remotely ([00:24:16](#)).
- Engagement Timeline and Logistics:** Gerry Perkel asked for an estimation of a project timeline for an industrial B2B company with 200 employees, to which Balasubramanian GR estimated that such an engagement would require one to two months, with 1.5 months being the sweet spot if performed onsite ([00:25:11](#)). Balasubramanian GR confirmed they are willing to travel to the United States for this duration, noting they have a valid visa until August 2029 ([00:28:04](#)).
- Personal Constraints:** Balasubramanian GR shared that they are expecting a child in approximately two to three weeks and will need to take a couple of weeks of paternity leave. Gerry Perkel offered congratulations and noted that

the project timeline allows for this absence as the preparations will not commence immediately ([00:27:12](#)) ([00:30:14](#)).

- **Relevant Experience:** Balasubramanian GR described previous consulting experience, including a project with an Indian manufacturing company where they redesigned a logistics workflow, reducing a 3-week process to 3-4 days ([00:28:04](#)). They also highlighted past experience with Unilever, which involved onboarding global analytics products and coordinating cross-functional teams to ensure standard compliance, technical integration, and project management ([00:29:03](#)).
- **Project Pricing Strategy:** Discussing potential fees, Balasubramanian GR initially suggested a range of 75k to 100k, but following Gerry Perkel's observation about the cost perception for a 6-week engagement, they adjusted the estimate to 40k to 50k as a competitive, effort-based sweet spot for a 1.5 to 2-month engagement ([00:31:18](#)).
- **Execution and Planning:** Balasubramanian GR detailed the proposed execution plan: holding introductory calls to identify key points of contact, creating a 6-week project plan before arrival, and coordinating necessary site visits or departmental meetings in advance to ensure the onsite duration is maximized for efficiency ([00:33:32](#)).
- **Stakeholder Discovery:** Regarding the engagement process, Balasubramanian GR confirmed they would arrive with a pre-planned questionnaire tailored to the departments identified in introductory calls ([00:35:48](#)). They suggested that providing these questions to clients beforehand could potentially shorten the engagement length by allowing stakeholders to prepare their answers, thereby saving time and cost ([00:36:44](#)).
- **Client Overview (Weights):** Gerry Perkel provided background on the specific client, "Weights," which manufactures sensors for temperature and vibration analysis ([00:37:48](#)). The company serves 200 to 300 clients across 700 to 1,000 sites, managing approximately 500,000 sensors, and uses machine learning and AI to alert customers to potential equipment failures ([00:38:44](#)).
- **Strategic Objective for Weights:** Gerry Perkel explained that the CEO of Weights is highly proficient in AI and has challenged the executive team to present a plan within three weeks on how to run the company without adding more human headcount ([00:41:40](#)). The goal for Gerry Perkel and the COO is to

build a roadmap by the end of the year to double revenue per white-collar employee, a task that requires formal, coordinated guidance rather than ad-hoc departmental efforts ([00:42:52](#)).

- **Project Scope and Focus Areas:** Gerry Perkel suggested the project should exclude the software development team, as they already have a defined roadmap, and instead focus on other functions like Sales, Business Development, and Marketing. Balasubramanian GR agreed, noting these areas offer high potential for revenue growth and efficiency improvements ([00:45:13](#)).
- **Revenue Projection Models:** Balasubramanian GR cited past work with a company called Titan, where they developed revenue and lifetime value projection models for subscription products. They suggested applying similar logic to the client's marketing and sales teams to identify which prospective clients to prioritize, thereby increasing the revenue-per-employee metric ([00:47:20](#)).
- **Data Readiness and Connectivity:** Discussing the client's data infrastructure, Gerry Perkel noted that while the client uses systems like NetSuite and HubSpot, they suffer from data silos and fear that their data is not "ready" for AI. Balasubramanian GR emphasized the ability to create a streamlined, unified data system that connects marketing, sales, and production to provide leadership with actionable insights ([00:49:25](#)).
- **Next Steps and Resourcing:** Balasubramanian GR committed to conducting more research on Weights and preparing a structured execution proposal, with plans to discuss it with Philip and potentially schedule a follow-up call by the end of the week or early next week ([00:51:29](#)). Regarding potential scaling, Balasubramanian GR stated they are currently the only resource for this but are proactively reaching out to their network and friends in the United States to identify potential candidates should the need for additional help arise ([00:52:18](#)).

Gerry - Bala - Transcript

00:00:52

Balasubramanian GR: Hey. Hi. How are you?

Gerry Perkel: I'm going and and is Ba how I should

Balasubramanian GR: Morning. How are you? Good. Good.

Gerry Perkel: address you?

Balasubramanian GR: Uh, I'm I'm sorry. I I couldn't hear you properly. Can you?

Gerry Perkel: Is is Bala how I should address you?

Balasubramanian GR: Yeah. Yeah. Bal. Yeah.

Gerry Perkel: Okay. All right. Good.

Balasubramanian GR: Okay.

Gerry Perkel: Nice to meet you.

Balasubramanian GR: Yeah, nice to meet you too. So yeah, Philillip uh gave a very u small brief about uh uh you and uh and what could be talking about but apart from that um it's a pretty open conversation uh so I'm willing to uh listen and see like uh what we can discuss out of here but I don't know whether he gave gave an introduction about me what I have done before so if

Gerry Perkel: Okay.

Balasubramanian GR: it makes sense I can quickly take you through like what I have done like like a two three minute quick introduction Uh so if that helps.

00:01:47

Gerry Perkel: Yes. Let's go ahead and do that.

Balasubramanian GR: Yeah. So uh I mean I I I Philip must have told you like we uh both studied uh in the same engineering batch. Uh we both graduated out of the same college out of the same year but different uh uh specializations. Uh I specialized in mechanical, he specialized in electronics. Uh post which I worked in various uh IT services industries. Then I completed my uh post-graduation management in 2012. Uh and uh after that I worked in an organization a domain name uh registry uh based out of Mumbai for about uh 8 and a half years where I headed the data science and data analytics division for that organization. Uh post that uh I started my own consulting company u ran it for almost four four and a half years. um where I did data analytics and data science consultant uh consulting uh projects to various companies tech and non- tech companies across the country and uh uh for the last two two and a half months I've been with uh TechJS uh Philip uh reached out uh regarding this consultant part.

00:02:57

Balasubramanian GR: So I was very interesting. So u so I joined uh since the beginning of May. So yeah uh right now we are currently working on a couple of projects uh NSR Northstar recycling you'll know about it. So uh been handling notar recycling projects for the last uh seven eight

Gerry Perkel: What?

Balasubramanian GR: weeks. So yeah that's that's what it's been um that's what's been going so far.

Gerry Perkel: And and with Northstar, what is it you're doing?

Balasubramanian GR: So uh the couple of projects so first one is the NSR PHOPS project uh where uh I wasn't there initially but I joined uh halfway through but now I'm handling that. The other one is the uh CRM phase 3 project which is uh we started off with that we completed the DND sessions uh we have presented our proposal we just waiting for the Northstar

Gerry Perkel: All

Balasubramanian GR: leadership to get back to us with the green light. So apart from that um there's the another running project which is the ops AI project which was also uh running when I joined.

00:03:58

Balasubramanian GR: So I have started uh taking care of that also uh since last week. Cool.

Gerry Perkel: right. All right. So, let me tell you what Philip and I talked about um related to all of this.

Balasubramanian GR: Yeah.

Gerry Perkel: Um I'm finding that uh many uh c companies are saying listen we know we need to do something with AI. We don't know what exactly. We we think we should be able to become much more productive than we are if we leveraged hi AI properly but we really don't know where to start. and and the needs are in my view um less about technology and more more about how can you imagine a company that is AI or agentic AI centric and how is that different from you built a company that's human centric because that's what you had to use right and you see people talking on the internet about I've built a oneperson \$10 million company. And as hard as that may be,

Balasubramanian GR: Oh,

Gerry Perkel: it's a it's a lot easier than starting with a 50 person \$10 million company and trying to move it to a oneperson company, right?

00:05:28

Balasubramanian GR: agree.

Gerry Perkel: But the customers we're meeting are already the multiund person company. And you know, I'm a CEO coach and I work with lots of companies and including uh TechJS. And you know, the challenge I'm I'm putting out in front of my

clients is something like, how can you get to double your revenue per white collar employee? in two years or something like that. And for instance, the the big ops project we've been doing at Northstar will do that and more. It should allow them to to need less than half as many people to do the work that they do

Balasubramanian GR: Yeah.

Gerry Perkel: today. And so that was easy for Northstar. They were able to say, geez, we have a hundred people in this department. And the technology people say they think they can make this a lot better. Uh so that's an easy one to find. And if we can do that, the return on investment is large. Let's go. Lots of people don't have 100 person departments where it's so obvious and they have five person departments and 10 person departments and seven person departments and and they don't know whether

00:06:40

Balasubramanian GR: Yeah.

Gerry Perkel: AI can really impact those people. Although my experience so far is that the technology is not the limiting factor, the technology will do just about whatever you need it to do. It's really, can you imagine a world where instead of 10 people like the people at uh at our one TechJS customer, can you imagine instead of having 12 people do your bidding for commercial HVAC systems that you can have four people do it with the enabled by all of these agents and and stuff to do it and many of them can't imagine that. And what's missing is, okay, so I have one client in particular I'm thinking about and I think they buy in that that they should double the revenue per white collar employee over the next couple years. Okay, now what? And in their software development team, it's a pretty easy problem to think about. Okay, we're going to bring in cloud code and all this sort of stuff and we'll make people more productive. But you know where then where do we go?

00:07:53

Gerry Perkel: Because that's only a small portion of our white collar employee base. We we need to do this in in the other 200 employees or 300 employees we have. And so there's a need to help a company kind of evaluate what their company does, the processes that have to be completed for the business to run. Think about how they do them now, how they could be done differently, and kind of build a road map of, you know, here's the places with the most leverage to use Aentic AI. maybe here's a priority of which ones we ought to start with first. Here's a kind of a um you know a starting outline for the things that we might want to do and then we can bring the AI developers in and start working on how do we actually develop it and that sort of stuff. So question is, is that work You could

Balasubramanian GR: H yeah got it got it.

Gerry Perkel: do

Balasubramanian GR: Yeah, I mean so just from AC like what I can think of is uh first of all AI is again as you rightly pointed out is more being viewed as cost cutting tool rather than a revenue generating tool.

00:09:14

Balasubramanian GR: Uh I think that perception is very common. I mean correct me if I'm wrong please. Uh that's what I mean I have been experiencing across uh various companies uh within my network. If I speak to some of the uh people who are at a C level and people who are at an executive level, um they majorly view AI as something that can cut cost that can cut human resource and manpower. But the perspective that AI can actually help you in increasing revenue is not very common. But yes, I do believe that uh the same person can double uh his or her efficiency uh and uh which will directly u you know uh affect their revenue. So, so what the current consulting companies that I have been uh uh researching for the past few weeks, what they do is they generally go to a company and then they provide what do we call as an AI audit report or more like an AI readiness report or the the name differs between your Mckenzie's and your BCGs. the name differs but what they usually do is they uh get into the company they understand the current business flows and then they basically give them a report card saying that how AI ready they are and where they can implement AI to improve their current processes in terms of efficiency

00:10:35

Balasubramanian GR: gains in terms of revenue increase etc so and then they generally don't follow up on the execution part so so what we can propose I mean again top of my head I still need to do a lot more research on this. Uh like as I said like we can understand their business and understand where what they are doing and see where we can implement or where AI can help them to increase revenue first. Yes, cost cutting is also a point where we can definitely focus on where we can definitely recommend but uh we can focus our efforts and figure out where AI can help them in increasing revenue uh rather than just say that only cost cutting is the only way AI can help you. So I don't know whether whether that does it does that answer your question or is

Gerry Perkel: I think so.

Balasubramanian GR: it

Gerry Perkel: Let me let me just be a little more specific with this customer as a way of trying to test this hypothesis. So, I know this company pretty well. I've been working with them for three years and somebody needs to they have a lot of good functional professionals and leaders but they don't really have anybody who could do process mapping or could you know Yeah.

00:11:53

Gerry Perkel: outline the flows uh that have to happen uh and or look at those flows and say yeah but they don't they happen that way because you have people and they don't have to happen that way if you used AI and so we could rearchitect these flows such that they can deliver greater value to the client or as you said grow or do it more cost-effectively and looking across their various uh areas and um And so to me, there's kind of a two-step process. Um, assessing all of this and building a plan for what you'd

like to do. And then there's having a team that can actually implement that, right? And most of our effort today as tech Jays is on the implementing part of that.

Balasubramanian GR: What?

Gerry Perkel: And um I think we can increase the number of opportunities to implement if we can come in and offer a service to our clients to do the first part of this. Um and and you're doing some of that with and NSR like for instance they've got the are you working on the finance project the accounts receivable accounts payable

00:13:09

Balasubramanian GR: Yeah, I can't spare the project.

Gerry Perkel: project right? So in and through that you're kind of looking at all the things they do and figuring out

Balasubramanian GR: Yeah.

Gerry Perkel: okay is that what we need to do and what could the system do and do we still need a human in the loop someplace here for a while or whatever until the system learns more and more I assume that's what you're doing is that right and then you and then you're turning around saying okay and we can then build

Balasubramanian GR: Yeah.

Gerry Perkel: that for you and it will take us this long and it'll cost this much type of thing right and so Um but in that case uh my sense is they had some some amount of ideas of what they wanted to accomplish because they had already started this with another vendor and it didn't work out. So they've been doing some real thinking about that. But let me give you an example in the client client I'm now talking about. Okay, they have a business development rep department which has got I don't know 8 to 10 people in making phone calls, sending emails.

00:14:19

Gerry Perkel: Their job is to set a meeting up for one of their account executives and then that account executive does a discovery call and determines if this is a good opportunity and starts working on it tries to turn it into a sale. Okay. So, they have eight people and the job of these people is to produce a certain number of meetings per month and to get those scheduled and for them to be high quality, etc., and to make sure we're touching a bunch of targeted companies that we think could buy our systems, etc. and uh to make sure we're in touch with what's going on at those companies. Now, there are um so that process needs to continue. We need to continue to um book discovery calls with new clients. We need to somehow outreach to customers and find out are they interested? Are they doing anything now? What are they thinking about this? what kind of opportunity might there be that all that sort of stuff that's done with say eight humans.

00:15:28

Gerry Perkel: The internet's filled with people that say they've got AI agents doing business development. Don't know how good they are. Don't know how reasonable it is. And so, and those agents work 24/7 365 and and so they don't take times for breaks and dinner and lunch and everything else that sleep that the um humans do. And um in addition, you can probably have them speak any language you want them to speak now, which the people we hire don't. And so they can be deployed to help in Germany and France and Spain and Mexico and and any place. So now so somebody needs to take a look at this and say

Balasubramanian GR: Yeah.

Gerry Perkel: okay you know two years from now instead of generating 20 discovery calls a month by deploying eight people and having them do these following processes. We would like to have one person overseeing agents that do all of this stuff and the one person's there to, you know, pick up a call that somehow is a little unique or whatever that doesn't fit our model or whatever.

00:16:40

Gerry Perkel: And we should go build an AI agent that does all of these things you need to do to generate these things. and um and therefore we would be able to do more of it because we have AI agents that do it which would generate more leads and more business and by the way it would cost a whole lot less but it would take some investment to build the thing that would do that right so that's an example and then we need to take that example and that opportunity and we need to compare it to the three or four or five other good opportunities we find and say, "Is that one more important than going off and, you know, we have a set of customer support reps and they support the customers. Would we be better off doing that than trying to figure out a way to build agents that help that process, etc., etc.?" So in order to do that when you come in you've got to interview some people and you got to understand what the business development function really does and you know what the inputs are what the outputs are and what the process in the middle is and and and be able to look at it and say yeah that's probably doable by AI and begin to say and here's what the the uh value you would get out of it would be etc etc so and like I said they don't have anybody to do that so can you do

00:18:09

Balasubramanian GR: H. So, okay. So what we can do here is um as you rightly pointed out right like right now we are approaching every project even though we do a traditional design and discovery D&D phase where we pretty much do I would say about 75%age of what what these consultants do as an AI readiness uh report we understand their business process we understand whatever workflow that they want us to reimagine we understand that workflow and then we suggest them uh solutions start will help them improve the efficiency of the current workflow. Right? Uh and when we approach it, we approach it with an engineering mindset and and and with a solutioning mindset that this is how we are going to provide a solution rather than just understanding the current business flow and pointing out where they can make improvements where they can um make it better more efficient etc. Now another point

is uh rather than just plugging in AI agents wherever you have human operations that can be replaced by AI, what I would suggest is understand the complete flow and and and use this framework where you can first start with a simple process re-engineering rather than just force fitting AI into their current flow and uh see if that process re-engineering can help them improve their efficiency.

00:19:31

Balasubramanian GR: If not then you can move on to other steps where you can have a deterministic layer. If that also doesn't work then we can implement or we can suggest an AI layer. So rather than just telling them uh this is what we will do, we can say like hey this is your current process. This is where we feel like uh we feel where uh you can improvise in terms of a simple process re-engineering or implementing an agentic AI solution or any other AI capabilities you can build within this process and that will give you a certain level of efficiency gain. we can estimate an efficiency gain or an increase in revenue or any other way they can add value to their organization. So, so that can be like a report or more like a suggested report stating that this is what you can do and maybe to that you can add a small line that if you want to build this we can build it. So that is it's it's not it's not entirely different from what we are doing right now but it is different in a way that right now in our final uh uh at the end of our engagement we provide a solution on how we are going to implement it rather than that we tell them that what they can implement and how they can implement rather than telling that we can implement it immediately.

00:20:50

Gerry Perkel: Good.

Balasubramanian GR: who so it's just taking one step back from what we are doing this providing as a pure consulting assignment and tell them that this is what you can do to improve your current status quo. Uh that is what I had in my mind when Philip

and I were discussing about this. So does that's that is that something that the clients that you speak to are looking at or or are they looking at one level deeper also like hey you can tell us what to do but can you also implement it for them?

Gerry Perkel: Yeah, I I would say that Um, in some of these situations, it will be a clear first step to ending up doing the projects for them. At a company like Northstar,

Balasubramanian GR: H.

Gerry Perkel: they are completely incapable of doing that work themselves and they want they need a partner to do this. And right now, we're the trusted partner that they have. uh this particular company that I'm talking about actually has the technical capability to do this. I'm not I'm not sure they should, but they do have they could do that.

00:21:54

Balasubramanian GR: Interesting.

Gerry Perkel: And one of the reasons they do is they have a software development team and they've been going through the whole process of agentic AI development etc etc. And so they can deploy some of those people to a task like this. There's also kind of a misnomer in my view on many of these clients where they just think that you know they can kind of just tell all the people well just go start doing vibe coding yourself and you know let's let's have every function do their own and and I think you get a bunch of simple PC's that none of which work together none are secure none are hardened you get a you get a rat's nest of mess and everybody's got pretty pretty dashboards to show you and some cool little

Balasubramanian GR: Agree.

Gerry Perkel: demos to show you, but is it really the software you can run your company on? And I submit it really is not. And um and so,

Balasubramanian GR: Absolutely.

Gerry Perkel: you know, can we give everybody, you know, Claude and Chat GPT and have them come up with some little tools for themselves to make themselves more more productive?

00:23:07

Gerry Perkel: Absolutely. Yes. And we want to do all that. But you know for instance you're just not going to give to go to the guy that runs the BDR department and say okay from scratch write me a AI based BDR that runs all day and all night and does everything your BDR team does and does it better. It's just not going to work in in in my so um the companies need to have some sort of specific capability to do this. Some companies are choosing to build that department inhouse. Some are choosing to partner with people like us to basically be that brute

Balasubramanian GR: Thank you.

Gerry Perkel: force. And Northstar is a perfect example. Uh, Um, and um, and so I I think I think we would like to have this because I think if you go in and you do this work, you start to become trusted by the the the company, you have a leg up on anybody else who's going to do development because you know the problem set better than anybody else does.

00:24:16

Gerry Perkel: So it puts you in the best position if they are going to look for a partner, I think.

Balasubramanian GR: Yeah.

Gerry Perkel: And I think it puts you in good position to tell them why getting a partner is a better choice than building it a group themselves. And so all of those are in our favor in having this kind of capability.

Balasubramanian GR: Yeah.

Gerry Perkel: Now um it seems like some of this work is better done on site than it is from remote. You agree with that?

Balasubramanian GR: I absolutely absolutely agree with that because I have done uh I mean in in in my uh when I was doing my own consultancy when I was running my own consultancy now the best work has come uh when I was on site uh

Gerry Perkel: Yeah, I mean, when you're sitting with a group in a whiteboard and you can just do this stuff,

Balasubramanian GR: yeah

Gerry Perkel: it's way easier. I'm sorry. The tools of this stuff are fantastic, but they're not as good as that.

Balasubramanian GR: absolutely I no arguments there absolutely agree with you on that.

00:25:11

Gerry Perkel: Yeah. Okay. So, now here's the thing I'm trying to imagine.

Balasubramanian GR: Yeah.

Gerry Perkel: So, let's imagine that they hired us to this company uh hired us to build a plan for them. Here's what the things we think you ought to go do and uh kind of outlines the the key things, maybe some priorities, a little bit of a road map if you will to do it. And you have two choices now. Go hire a team to start working on this or hire us or somebody else to do this. Um, and I've got a company of, you know, 200 employees, 50 million in revenue, growing in industrial B2B company. Um, and I'm trying to get a sense how long does something like that take? And so, and it's a it's completely unfair question, I realize because you you don't have any real specifics,

Balasubramanian GR: No

Gerry Perkel: but I'm and I'm not looking for a specific answer as much as I'm looking for an order of magnitude

Balasubramanian GR: context.

Gerry Perkel: answer. It doesn't seem like it's a week's worth of work.

00:26:18

Gerry Perkel: It seems like it's more than that. It doesn't seem like it's three or four months worth of work. It's someplace in between that it seems like to me. Is that kind of your feel?

Balasubramanian GR: Yeah,

Gerry Perkel: It's a month or six weeks or maybe two months kind of a

Balasubramanian GR: I agree. So if you do it remotely,

Gerry Perkel: thing.

Balasubramanian GR: right? Like then you need to add probably I mean let's assume we are doing it on-site first. Let's uh let's assume that.

Gerry Perkel: Yeah.

Balasubramanian GR: So if you're doing it onsite, uh if it's an entire business workflow we are trying to reimagine or any other uh as I said like an AI readiness report that we are giving I would say anywhere between one to two months should be ideal if I'm

Gerry Perkel: Right?

Balasubramanian GR: if if we are present on site but yeah if it's if it's done via uh via remote then I would say double the time minimum double the time because obviously the the time difference is there yeah productivity is you can

00:27:12

Gerry Perkel: Because the productivity is worse, you know.

Balasubramanian GR: maximum collaborate for what two three hours a day uh but if if someone's on site then that that gives us like at least six 7 hours a day or even more uh depending on the client's uh capability. So yeah, one and a half I would say one to two months, one and a half months should be a sweet spot.

Gerry Perkel: Mhm.

Balasubramanian GR: Uh that kind of an

Gerry Perkel: Okay. So, let's say this company wanted to do that.

Balasubramanian GR: engagement.

Gerry Perkel: Can you come to the States for a month and a half?

Balasubramanian GR: Uh yeah, absolutely. Actually I was just telling Philip to uh there is a personal uh reason for me to be here for some time. Actually I'm we're expecting a child. So uh I'll be going on my paternity leave.

Gerry Perkel: Congratulations.

Balasubramanian GR: Thank you very much. I'll be going on my paternity leave for a couple of weeks. So apart from that uh I'm completely available.

Gerry Perkel: What when is your baby due?

00:28:04

Balasubramanian GR: Uh another two weeks we're expecting somewhere about two to three weeks. So uh so that's the expectation.

Gerry Perkel: I'm expecting my first grandchild in two to three weeks. So

Balasubramanian GR: Oh lovely lovely. Great. So uh so yeah that's the only point.

Gerry Perkel: yeah,

Balasubramanian GR: Apart from that, I have an active visa that's uh valid till August 2029. So, so those are not a problem at all. So, traveling that's not an issue. So, just that that part is the only thing I was telling Philip. So, he said like we can figure it out accordingly. So,

Gerry Perkel: now did you do any of this kind of work in your consulting

Balasubramanian GR: yeah.

Gerry Perkel: company?

Balasubramanian GR: Uh so I did one uh but that was not an overall reimagination but that uh I reimagined their uh but a local an Indian company who is uh a very traditional manufacturing company uh running for almost three generations uh the third generation family is now running the business and they want to modernize their uh logistics and uh their logistics workflow.

00:29:03

Balasubramanian GR: So I reimagined their logistics workflow for them and uh improved their efficiency like things that took 2 3 weeks for them to complete uh the solution that I provided uh cut down the 3 weeks process to about 3 4 days. So so that kind of work I have done um uh but yeah not anyone outside India as of now but yes I do have uh experience working with clients outside uh uh outside India. So uh in my initial days I was uh working with Uni Liver. I I did a project with Uni Liver Limited. Uh so we uh collaborated with teams across the world across Uni Liver u Uni Liver uh resources across the world. The idea, the project was to onboard um any analytics product that is by a specific team and they wanted to implement that product across the companywide. Uh our team was uh studying those products and making sure those products comply to uni labor standards. We uh onboard those products we create uh a devops or an MLOps whichever that's required for the product.

00:30:14

Balasubramanian GR: We create a project management team. We create a technical team. We make sure the product is smoothly on boarded. So that was a project that I did but where we have collaborated with various clients uh uh across the world. So so that is not something uh that that's something that I can I can very well do that's not a problem. Um just at this part like this uh this two weeks part of paternity leave that's the only thing otherwise

Gerry Perkel: Yeah. No, no, no.

Balasubramanian GR: nothing's stopping.

Gerry Perkel: It It won't happen that fast anyway,

Balasubramanian GR: Yeah.

Gerry Perkel: so that's fine.

Balasubramanian GR: Yeah.

Gerry Perkel: Okay.

Balasubramanian GR: Yeah.

Gerry Perkel: So, assuming it's like a six-week project or something like that to do this, um, what do you think the pricing for something like that should

Balasubramanian GR: uh so 6 weeks project I'm thinking somewhere about I mean we can do it somewhere

Gerry Perkel: be?

Balasubramanian GR: around uh again I need to go back and and do a more detailed calculations but I'm just giving you a rough top of my head uh calculation so we usually like in techs you must know that we do a lot value based uh pricing.

00:31:18

Balasubramanian GR: So uh but if I have to convert it that into a pure and effort based pricing, we could uh price it somewhere around uh anywhere between 75 to 100K. But again that is again based on uh the the kind of value that we are creating, the kind of problem that we are solving. Uh but 75 to 100K but it can go up also but it can come down also. uh again depending on the kind of uh solution that we are providing. So again this is a very top of my head number but and can go back and work on it even uh much more detailed on this.

Gerry Perkel: Okay. And so, um,

Balasubramanian GR: So

Gerry Perkel: so if I'm a customer here, I I don't disagree with you that it probably has value like that. Um, but uh if I'm a a customer and I'm saying, "Okay, well, you're going to you're going to give me one of your people for a month and a half and they clearly can't cost you anywhere near 75 to 100,000.

00:32:26

Gerry Perkel: And so why does it cost so much?" And um how how do you how do you respond to that?

Balasubramanian GR: Okay. So, okay. From an F4 perspective, I agree actually like while I was while I was telling I realized that uh 75 to 100 will be uh not the kind of uh pricing that someone will expect. So let's say somewhere about uh 25 to 30k a month. So we could do it somewhere around 40 45K.

Gerry Perkel: Yeah.

Balasubramanian GR: So 40 to 50K would I think that would be a sweet spot if I'm for for a one and a half two

Gerry Perkel: Okay.

Balasubramanian GR: month or an 6 week 7 week

Gerry Perkel: Okay.

Balasubramanian GR: engagement

Gerry Perkel: And um and if we were to do this um do you have a process you would follow or Okay, you you fly over here and you show up day one. What do we do?

Balasubramanian GR: Uh okay. So what we can do is like maybe before we reach there we can probably have a couple of introductory calls and uh uh first of all we can set the stage up.

00:33:32

Balasubramanian GR: We can make sure u who will be the responsible uh point of contact from the client side who will be uh engaging with us uh throughout this period like six seven week period who will be uh helping us get details or connect us to people uh or all the departments whom we should be uh contacting. So, so we can set all those stops during the introductory call. Um, and then once we fly there, we can uh sit with that person and and even before flying there, we can give them a a six week plan

on how we are going to go about it. And then we can ask them to u set those things ready there.

Gerry Perkel: Mhm.

Balasubramanian GR: Like if we have to go to let's say if it's a if it's a manufacturing company just thinking out loud, right? If it's a manufacturing company, if they have a manufacturing flow set up somewhere and if that is needed for us to go and visit, so they can arrange for those manu for those visits etc. uh if they are if if if they have more than one uh office uh in US and if it's if it's needed for us to go and visit those offices so those logistics can be planned in advance and uh make sure that those can be uh uh planned and set ready.

00:34:49

Balasubramanian GR: Uh so what we can do is we can make sure that what we are going to do in that six weeks or seven weeks time we can create a clear plan and clear um well established uh process for that six seven weeks. Um and then we can travel and make sure that we follow whatever we had planned for those six seven weeks. Obviously we'll keep some buffer here and there to make sure that you know if anything comes up we have uh buffer for us to accommodate those issues. So that would be an ideal way of doing it. Uh but again uh if the client wants it in a different way,

Gerry Perkel: Okay.

Balasubramanian GR: we can work it out uh in a different way. But that will be an ideal way of doing it. Like we set everything up before we start with a couple of introductory calls um before we fly and uh we have everything ready and set up. Like once we go there, we spend uh as minimal time as possible and make sure that it's very efficient and you know we don't uh stay there uh more than what we expect us to expect us to say.

00:35:48

Gerry Perkel: Yeah.

Balasubramanian GR: Therefore,

Gerry Perkel: Okay. Um,

Balasubramanian GR: Excuse

Gerry Perkel: Okay. So, um we do that we, you know, sit down with the the head of customer service,

Balasubramanian GR: me.

Gerry Perkel: right? All right. What how what do we do? What how do we start? Do we have a set of questions we want to go through already that are pre-planned or how are you approaching that?

Balasubramanian GR: Yeah. So, so we will we will have our questions pre-planned before that. Uh so we will uh so we will create a plan for us and uh because in the introductory calls we will have an idea of uh which all departments we are going to talk to which all uh personal we are going to talk to. So we will have our questionnaire ready we'll have the the list of details or the things that we need to discover out of these sessions ready and uh we uh we will plan our questionnaire and the way we are going to approach is ready.

00:36:44

Balasubramanian GR: So let's say if the head of customer service we meet them we will we can again do it in two ways. We can either present these questions to them uh and make them let them be prepared when we go there and when we go there we can get those questions answered or we can go there and answer those questions uh right uh uh right there face to face and get those answers and uh and and and and and continue from there onwards. So,

Gerry Perkel: Mhm.

Balasubramanian GR: so again either way is fine. Uh whichever way the client is okay dealing uh with if they feel that presending those questions will save some time can reduce the six week engagement to a fivewe engagement which could uh which could save some cost for the uh client then that's also can be worked out.

Gerry Perkel: Okay. All right. Okay. Um, what other questions do you have for

Balasubramanian GR: Um uh any other information?

Gerry Perkel: me?

Balasubramanian GR: I I I I I assume that you may not be able to publish a lot more in details about the the client that we are talking about.

00:37:48

Balasubramanian GR: Um uh but if there's anything else Oh

Gerry Perkel: Tell you anything you want to know. So ask away if you have some

Balasubramanian GR: okay. Okay. Okay. So you mentioned that the client has their own software development team and they are are they are

Gerry Perkel: questions.

Balasubramanian GR: they well into first of all the is the which company is this? Uh uh Philip gave me an idea but uh I'm still not very sure what he said weights and

Gerry Perkel: Yeah.

Balasubramanian GR: I did my research on weights and uh

Gerry Perkel: What what what they do is they make um sensors that measure temperature and vibration and then they go into

Balasubramanian GR: Yeah.

Gerry Perkel: manufacturing companies and they attach these sensors to manufacturing equipment. They take all the readings they built they have built a a their own network protocol to connect these things all together. They take all those readings, they move them up to the cellularly up to the cloud, and then they have a set of of machine learning and AI uh stuff that crunches

00:38:44

Balasubramanian GR: Heat.

Gerry Perkel: all of that data and comes up with a first set of here's some things you should look at or pay attention could be a problem. They then have a set of human um uh vibration an analyst look at the data and further uh qualify and then they communicate that data back to the customer and say, "Hey, machine number seven is one you better look at because if you don't, it's probably going to go down and we we don't want it to go down because that would stop your manufacturing line." Okay, so that's what they do and they do that currently for probably two to 300 companies and probably I don't know 700 to a,000 sites and um

Balasubramanian GR: Okay.

Gerry Perkel: they've got probably 500,000 sensors out in the marketplace

Balasubramanian GR: Okay.

Gerry Perkel: and Um, and so they have a a a sales team that, you know, that's pretty big, 15, 20 people that's working with these clients. They have a business development team that's trying to create leads. They have a customer service team that takes the information from the analysts and calls the client and has monthly reviews, etc. They have a marketing team that's trying to create demand, etc. They have a software development team that is building the AI analysis and and trying to make that better and better to ultimately not need so many vibration analysts.

00:40:25

Gerry Perkel: They have a hardware development team that is building the sensors and coming up with new sensors and things like that. And they have a product team that sits between engineering and the uh sales team and marketing team. And then most of the manufacturing is outsourced, but they do some some final assembly at the

end. Uh they also have an installation team that goes into these factories and installs these products. Uh and um so that's kind of the way the company works.

Balasubramanian GR: guard guard I mean I I did my research on them so pretty much

Gerry Perkel: Okay.

Balasubramanian GR: matches uh so yeah I I was going through their uh their services what they offer etc. So I mean as you rightly pointed out they look like they are well into uh using AI and implementing not just uh AI as a software but AI and hardware also and trying to understand how machines uh what as you as you said like the sensors that can uh predetect uh machines that are about to fail are about to um you know malfunction and can save a lot for these companies in terms of fixing these before the the the risk happens.

00:41:40

Balasubramanian GR: So, so yeah, I mean they they looks like they're well into um well into AI

Gerry Perkel: Yeah. So, for the software stuff,

Balasubramanian GR: and Yeah.

Gerry Perkel: they're well into using Aentic AI.

Balasubramanian GR: Yeah.

Gerry Perkel: The CEO is very capable himself at using Agenta AI. He's vibe coding 10 hours a day these days. They're in the process of of probably rewriting their core software uh to have a fresh look at it and uh he's working with the team on that. And because he's so knowledgeable about what can be done, he's certain that if we did the right things in the rest of the company, we could get tremendous improvement by leveraging Agentic AI and you have little pockets where somebody's done some good work and somebody started developing an

Balasubramanian GR: Absolutely.

Gerry Perkel: application etc. But it's not well coordinated. It's not a road map. Um there's no real clear path to answering the question of how do we increase our revenue per person by by 2x in two years two to three years and that's the question.

00:42:52

Balasubramanian GR: Got

Gerry Perkel: So the COO uh and I have been chartered

Balasubramanian GR: it.

Gerry Perkel: with um getting a plan built on how to do that by the end of the year. And in in between now and the end of September, we have to finalize how we're going to make that happen. And so I'm talking to you and trying to see I'm I'm meeting with the COO tomorrow and trying to understand how does she want to go about doing this. Now in parallel, the CEO issued a challenge to the executive team when I was there last week and there's I don't know eight executives or something like that. And he said to each of them, I want you to come back to me and show me a plan in in three weeks where all we would need to run the company is the eight of you that you don't need any people in your department. I want you to describe to me how and what we would have to go do AI development wise. So you don't need any more people by yourself.

00:44:00

Gerry Perkel: Now, he doesn't believe that you can do that, but he's trying to stretch their thinking and and get them to think more about how how this could be different because he believes that this AI movement is transformational and revolutionary and thinks his team is acting as if it's a minor productivity improvement tool set and he wants to look at the more transformative approach.

Balasubramanian GR: Hat.

Gerry Perkel: And so this was his way of getting them to think outside the box towards that. Now I don't think that's going to produce much of any value. Maybe it'll get them to think a little differently. What I think is you need to have a formal program

to go off and work with those people with somebody like yourself to kind of think through that question because there's no way that chief

Balasubramanian GR: Okay.

Gerry Perkel: marketing officer is going to really know how to do something like that and you know asking her to do that is it's just not a reasonable request.

Balasubramanian GR: Absolutely. Got it. Got it. Yeah, that that that is definitely that was one of the ways uh we can execute it like as you rightly pointed out right like we can go department by department.

00:45:13

Balasubramanian GR: uh we can we can probably I mean we can probably target where uh which is going to give them

Gerry Perkel: Yeah.

Balasubramanian GR: maximum value or uh wherever the the client or the CEO thinks that we need to start with uh as you as you pointed out like as I was doing my it's also like they're already uh implementing a lot of agentic AI in their uh software development and uh also in how they read the data from the sensors and how they can send those alerts. uh they also have dashboards that can uh give their clients um uh timely alerts and timely uh information on on on where to take action and what what actions to be taken. So they are very well equipped. I mean looks like at least based on my research it looks like they're very well equipped there. But on the other non-technical functions like sales and business development and marketing there is where I believe the value or the opportunity is maybe we can start with those areas. Uh

Gerry Perkel: Yeah, I think this would be a project that probably excludes the software

00:46:12

Balasubramanian GR: like

Gerry Perkel: development area because they they've already got a plan as to what they're doing,

Balasubramanian GR: Yeah.

Gerry Perkel: but it's everything but that and which is actually the bulk of the people and uh the bulk of the processes and um

Balasubramanian GR: Yeah.

Gerry Perkel: and figuring out how we can you really reimagine the company. Um, not so much so we can cut a bunch of people as so much as we could maybe double the revenue of this company with the people we have.

Balasubramanian GR: Yeah.

Gerry Perkel: And I I don't I I don't think that's outside the realm of possibility and maybe even more than

Balasubramanian GR: Yeah.

Gerry Perkel: that. And this is not a problem set that's unique to this one client. I have lots of other clients that are trying to figure out this same thing. Uh and and and kind of don't know how to go about it and you know they they kind of hide behind the I don't understand the technology and I keep trying to tell them it's it that's you don't have to worry about that.

00:47:20

Gerry Perkel: I haven't seen anybody come up with a problem they want to solve. We can't solve yet. So that's not the problem.

Balasubramanian GR: Yeah.

Gerry Perkel: The problem is figure out what you want to solve.

Balasubramanian GR: Yeah.

Gerry Perkel: And it's really a business process planning and organizational reimagination problem. And the limit is perhaps your imagination. And that's a real limit, but it's not a technology problem from what I've seen so

Balasubramanian GR: Yeah.

Gerry Perkel: far.

Balasubramanian GR: again the two main uh functions right sales which is going to drive your revenue and marketing I believe is one of uh their biggest cost centers. So uh like one of the projects that I did with a tech company uh it's called Titan. It's it's an email provider. Uh so I I developed a a revenue projection uh or a value projection for every product that they sell. It's a subscription based product. So uh my the solution that I provided would help them understand the value or the net present value or the lifetime value generated by one sale at the time of sale so that they know exactly where to concentrate which clients to put more effort on which areas to put more effort on so that they can really make their marketing process even more efficient than what it is right now.

00:48:35

Balasubramanian GR: So on the top of my head we can do something like that. we can we can implement a lot of these solutions to their marketing team and tell them where exactly to put your

Gerry Perkel: What?

Balasubramanian GR: effort on rather than wasting your effort on many things and save a lot of marketing dollars there and same on the sales side. Um who will be your more prospective client which client will give you more uh revenue at a certain particular point of time. So we can give them that intelligence so that that they can and to answer your the first question that you said right like we can increase the revenue from a white collar employee double or triple it over a period of time. So those are the areas that comes to my mind immediately but I'll do my uh I'll do more research on this and probably get back to you with some more well structured uh uh areas where we can where we can focus on. Um, will

Gerry Perkel: and and I think and then along with this is also some

00:49:25

Balasubramanian GR: that

Gerry Perkel: some discussion about where does the information sit to do all this because you know they have Netsuite, they have HubSpot, they've got some other internal systems and not everything talks to each other today. And so I'm sure there's some data readiness issues, but they've been but people have been so scared by stuff they've read that if you don't have your data ready, you can't start that they hide behind that, too. Well, our data is not ready. Well, you're gonna get passed by by your competition if you don't get on something. And my sense so far has been we can kind of help fix some of the data connectivity problems. It's not that hard.

Balasubramanian GR: Yeah.

Gerry Perkel: And uh so

Balasubramanian GR: Yeah, definitely. We can create one streamlined uh uh sort of a system like a data

Gerry Perkel: can

Balasubramanian GR: system something that runs throughout the organization touches every part and well connected so that what's happening in marketing can relate to what's happening in sales and can provide uh and what's happening in production and can give a unified view to someone sitting at the top and tell them where we can get better.

00:50:43

Balasubramanian GR: So that's definitely something that can be worked on also as you said I mean as we discussed there are a lot many uh avenues and lot many opportunities that we can work around. So yeah, definitely. Definitely something. This is something that can be executed.

Gerry Perkel: Okay. All right.

Balasubramanian GR: Yeah.

Gerry Perkel: Uh, is this your first child coming?

Balasubramanian GR: Uh yeah.

Gerry Perkel: Ah. Oh, really exciting then.

Balasubramanian GR: Thank you.

Gerry Perkel: Yeah.

Balasubramanian GR: Thank you so much.

Gerry Perkel: Yeah. And do you know if it's a boy or a girl?

Balasubramanian GR: Uh no, we uh in India it's not allowed uh to

Gerry Perkel: Ah. Oh, I see. Is that right? Okay.

Balasubramanian GR: Yeah.

Gerry Perkel: Yeah. Interesting.

Balasubramanian GR: Yeah.

Gerry Perkel: Okay. Well, that'll be exciting.

Balasubramanian GR: Correct. Yeah.

Gerry Perkel: And and do you have parents and and her parents around that can help if to make

Balasubramanian GR: Yeah. Yeah.

Gerry Perkel: this all work well?

00:51:29

Balasubramanian GR: Yeah. Yeah. Her parents are here. So, yeah.

Gerry Perkel: Ah, okay. Good.

Balasubramanian GR: Yeah. That's good.

Gerry Perkel: And where are you located,

Balasubramanian GR: Yeah.

Gerry Perkel: Bala?

Balasubramanian GR: Uh Bangalore.

Gerry Perkel: You're in Bangalore. Okay.

Balasubramanian GR: Yeah.

Gerry Perkel: All right.

Balasubramanian GR: Yeah.

Gerry Perkel: Good.

Balasubramanian GR: Good.

Gerry Perkel: Any other questions for me?

Balasubramanian GR: Uh not right now. Okay. So, what I'll do, I'll go back uh I'll do more uh research on uh weights what we have discussed. uh then I'll come back to you with a more structured idea of how we can uh execute this. Uh you can review it and you can let me know like what could work, what could not work.

Gerry Perkel: Sure.

Balasubramanian GR: Maybe we can have another call uh maybe end of this week Friday or maybe early next week whichever works for you better. Um based on that we can take this forward and I'll have a word with Philip also on this and hear what he thinks about it uh and get his ideas also and uh and get back to you on this.

00:52:18

Gerry Perkel: Yeah. Now, weights um is an interesting uh situation that they're probably have a a preconceived notion that they wouldn't hire anybody to do the development that they would do it themselves somehow or bring it inhouse. Now, they might change that. Philip and the CEO of Weights have met and and had a conversation and so uh he knows of us and doing this project with Weights would probably be as much for learning for us about how we could do this and present it and offer it to others as it is you know to lead to a big project and etc. So, we want not decide to do it, but it I think we would learn a lot along the way and help polish what we can communicate to others that we can do. Um, if we had a bunch of clients sign up, do we have anybody else besides you that can do

Balasubramanian GR: uh that is something that I need to uh work on like right now it's only me I was actually talking about this

Gerry Perkel: this?

Balasubramanian GR: to Philip also on uh adding more resources to this uh my first idea is to find internally uh if there is someone in techjs who already capable of doing this rather than going outside but yes if the need arises we will have to start recruiting so uh I'm

00:53:47

Gerry Perkel: Well,

Balasubramanian GR: already uh reaching out to my

Gerry Perkel: based here in the states as well to do this, you know, I I don't know. That's another

Balasubramanian GR: Yeah, I'm reaching out to my network. I'm seeing like a lot of my friends,

Gerry Perkel: question.

Balasubramanian GR: my know ex-colagues, my batchmates who are in US who will be willing to take this up. So, I've been trying to reach them is uh reach out to them and see if anyone will be interested in that.

Gerry Perkel: Okay. All right.

Balasubramanian GR: So,

Gerry Perkel: All right. Great. Well, pleasure to meet you. Any other questions I can answer for

Balasubramanian GR: no,

Gerry Perkel: you?

Balasubramanian GR: not nothing uh as of now. Gary, if there's something I'll reach out to you, I'll message you.

Gerry Perkel: Okay.

Balasubramanian GR: Great. Um, again, thank you. Thank you. It's a it's a great pleasure to meet you also. Uh, good to talk to you and uh and and it's really exciting, right? Like this these kind of opportunities pushes you and uh uh helps you understand

more about these industries. So really really excited to start on this. So uh let me get back to you uh on on what I promised and uh and from there we'll take it

Gerry Perkel: Correct.

Balasubramanian GR: forward.

Gerry Perkel: All right, brother. Great to meet you.

Balasubramanian GR: Great.

Gerry Perkel: Thank you.

Balasubramanian GR: Thank you. Thank you so much for your time and have a good day.

Gerry Perkel: All right. Go back.

Balasubramanian GR: Bye-bye.
